Product Requirements Document

Aligned launch scope for the dreigewinnt.com MVP

Version 1.1 | March 2026 | Working build spec

Drei Städte. Eine Plattform. Drei Gewinner.

Region Raunheim · Kelsterbach · Rüsselsheim	Approach Revenue-first, lean MVP	Build Window ~8–10 weeks	Operator Model Approve, don't create
--	--	------------------------------------	--

1. Executive Summary

dreigewinnt.com is a hyperlocal digital hub for Raunheim, Kelsterbach and Rüsselsheim. The launch version focuses on one clear promise: help residents discover local businesses and events while giving local businesses a simple, affordable way to be visible online.

This revised PRD intentionally tightens the MVP. The launch scope is smaller than the original concept, but stronger: fewer moving parts, cleaner operations, and a clearer path to revenue.

The product will launch with five core capabilities: a business directory, an events calendar, a simple local news section, a single admin moderation queue, and paid commercial placements via Stripe. A limited Telegram business bot is included as a controlled beta feature for paid listings.

1.1 Product Summary

Field	Decision
Product	dreigewinnt.com — hyperlocal community hub
Primary audience	Residents, local businesses, clubs and organisers in the Dreigewinnt region
Core launch value	Find what is happening locally and help local businesses get discovered
Primary revenue at launch	Paid business listings, featured events, and direct-sold banner ads
Key differentiator	Telegram business bot beta for low-friction business updates
Editorial stance	Trust first: all submitted or AI-assisted content is reviewed before publication
Launch philosophy	Ship the smallest version that can earn revenue and be operated by one person

1.2 Problem Statement

The three towns have no single digital home for local discovery. Residents currently rely on fragmented Facebook groups, scattered town pages, business websites, and traditional local media. Businesses, clubs, and organisers do not have a lightweight local channel to reach people consistently.

The opportunity is not to build a broad community platform from day one. It is to become the most useful local utility for discovery and visibility, then expand carefully once the core loop works.

1.3 Launch Decision

Launch scope is intentionally limited. The MVP is built around directory depth, event supply, clear monetisation, and a fast editorial workflow. Anything that adds heavy moderation, billing complexity, or automation risk is delayed until after launch.

Included in launch MVP	Deferred until after launch
Business directory with free and paid tiers	Resident reviews

Events calendar with free submission and featured boost	Business stats dashboard
Basic news publishing via CMS	Recurring events
Unified admin queue	Jobs via Telegram
Stripe subscriptions and one-time payments	AI auto-publishing
Telegram bot beta for selected business actions	Social auto-posting and newsletter automation
Plausible analytics, basic SEO, legal pages	Native mobile app and ticketing

2. Goals, Non-Goals and Product Principles

2.1 Launch Goals

Goal	Target by end of Month 1 after launch
Seed useful local supply	50+ business listings and 20+ upcoming events live
Convert first paying customers	8–10 paid business listings and at least 5 featured events sold
Prove local demand	500–1,500 monthly visitors and repeat direct traffic
Keep operations sustainable	Median queue handling under 30 minutes per day
Validate the Telegram differentiator	3–5 paid businesses actively using the bot beta

2.2 Non-Goals for Launch

- No resident account system or community forum.
- No event ticketing, third-party payouts, or marketplace-style money handling.
- No attempt to automate every content source at launch.
- No requirement for a business-facing CMS or analytics dashboard in version 1.1.
- No expansion outside the three core towns before the local loop is working.

2.3 Product Principles

- Revenue-first scope: launch only what can generate value quickly or support conversion.
- Trust before automation: content quality and source traceability matter more than publishing speed.
- Single-operator friendly: the product should be operable by one person without constant manual entry.
- German-first and mobile-first: the majority of usage will be local, German-language, and on mobile devices.
- One source of truth: the PRD and roadmap must match exactly on scope, priorities, and sequencing.

3. Users and Operating Context

Persona	Description	Primary need
Resident	Mobile-first local user who wants a quick way to find businesses, events, and trusted local updates.	Useful, current local information in one place

Business owner	Often not highly technical; wants local visibility without managing another dashboard.	Affordable exposure and low-friction updates
Event organiser	Club, venue, community group, or business running local events.	Fast event promotion with optional paid boost
Platform admin	Single operator handling moderation, outreach, and monetisation.	Fast review workflow and clear priorities

4. Functional Requirements

Priority labels in this section use the following meaning: Must = required for launch, Should = important soon after launch, Later = intentionally deferred.

4.1 Business Directory

The directory is the commercial anchor of the platform. It should feel useful with free listings, but clearly more valuable for paid businesses.

ID	Requirement	Acceptance criteria	Priority
BD-01	Residents can browse and filter businesses by town, category and keyword.	Search returns relevant results with name, category, town, address and tier treatment.	Must
BD-02	Each business has a public profile page.	Profile includes core details, opening hours, description, phone, website and photo gallery.	Must
BD-03	Businesses can submit a listing via a public form.	New submissions enter the moderation queue with Pending status.	Must
BD-04	Three listing tiers are supported: Free, Standard and Premium.	Tier logic affects visible fields and placement consistently across list and detail views.	Must
BD-05	Standard and Premium listings are purchasable through Stripe.	Checkout, webhook handling, failed payment handling and cancellation path work end to end.	Must
BD-06	Premium listings can be featured in category views.	Premium businesses show featured styling and top placement rules where configured.	Must
BD-07	Paid businesses can request listing updates via Telegram beta.	Supported launch actions are opening-hours changes, photo upload, short announcement, and offer submission.	Must
BD-08	Residents can leave reviews.	Deferred; not available at launch.	Later
BD-09	Businesses can view listing	Deferred; basic stats dashboard	Later

	analytics.	comes after launch.	
--	------------	---------------------	--

4.1.1 Launch Pricing

Tier	Price	Included at launch
Free	€0	Name, category, town, address, phone, website, one photo
Standard	€9.99 / month	Free features + description, opening hours, up to five photos
Premium	€29.99 / month	Standard features + featured placement, premium styling, Telegram bot beta access

4.2 Events Calendar

Events are the second launch anchor because they create repeat traffic and a natural reason for organisers to interact with the platform.

ID	Requirement	Acceptance criteria	Priority
EV-01	Residents can browse upcoming events by town and date.	Upcoming events are filterable, sortable and hidden when expired unless explicitly requested.	Must
EV-02	Each event has a public detail page.	Page includes title, description, venue, date, time, organiser info and map/embed-safe location info.	Must
EV-03	Users can add an event to their personal calendar.	Each event provides a working .ics export.	Must
EV-04	Organisers can submit a free event listing.	Submissions go to the moderation queue for review before publication.	Must
EV-05	Organisers can buy a featured event boost.	One-time Stripe payment highlights the event until the event date.	Must
EV-06	Recurring events are supported.	Deferred until after launch.	Later

4.2.1 Event Boost Pricing

Product	Price	Notes
Featured event boost	€12 one-time	Highlighted placement in relevant event views until the event date

4.3 Local News

News exists at launch primarily to make the platform feel alive and locally relevant. The launch model is manual-first: publish fewer items, but publish cleanly and consistently.

ID	Requirement	Acceptance criteria	Priority
LN-01	The admin can publish and edit local articles in a CMS.	Articles support title, body, excerpt, town tags, hero image and publish date.	Must
LN-02	Residents can browse a news feed and filter by town.	News archive is readable, mobile-friendly and town-filtered.	Must
LN-03	Each article has an SEO-friendly public page.	Meta title, description, open graph fields and related content support are present.	Must
LN-04	Residents can submit a news tip.	Optional for launch; can be enabled if moderation capacity allows.	Should
LN-05	External-source AI ingestion drafts articles automatically.	Deferred to post-launch beta; not required for launch readiness.	Later
LN-06	The platform publishes an RSS feed.	Feed exposes recent articles for syndication and indexing.	Should

4.4 Telegram Business Bot (Beta)

The Telegram bot is included at launch, but only as a tightly scoped beta. It is not a full business operating system. It is a lightweight submission channel for paid businesses.

ID	Requirement	Acceptance criteria	Priority
TB-01	Paid businesses can authenticate their Telegram account using a one-time code.	The /start code links one Telegram account to one approved business profile.	Must
TB-02	The bot supports a limited set of launch intents.	Launch intents are: opening hours update, photo upload, short announcement, and special offer.	Must
TB-03	The bot shows a preview and requires confirmation before submission.	Structured preview appears in chat and the user must confirm before anything enters the queue.	Must
TB-04	Low-confidence messages are handled safely.	The bot asks clarifying questions or offers a menu when confidence is below threshold.	Must
TB-05	Bot-submitted changes enter the moderation queue.	No launch action is auto-published and no listing data is	Must

		overwritten without review.	
TB-06	Events and jobs can be posted through Telegram.	Deferred until after launch.	Later

4.5 Admin Operations

The admin dashboard is the real operating system of the platform. The fastest workflow is more important than feature richness.

ID	Requirement	Acceptance criteria	Priority
AD-01	All pending items appear in one queue.	Business submissions, event submissions, Telegram updates and optional news tips are visible in a single queue.	Must
AD-02	The admin can approve, reject or edit queued items quickly.	Each item supports approve, reject and edit-before-approve actions.	Must
AD-03	The admin can manage business tiers and banner placements.	Paid status, manual ad slots and placement dates are editable from the dashboard.	Must
AD-04	The dashboard exposes simple operating KPIs.	Launch KPIs include queue size, active listings, active events and current month Stripe revenue.	Should
AD-05	A detailed analytics panel exists for businesses.	Deferred until after launch.	Later

4.6 Monetisation

Launch monetisation must stay legally and operationally simple. Only platform-owned revenue streams are included.

Revenue stream	Launch status	Implementation note
Business subscriptions	Launch	Stripe recurring billing for Standard and Premium tiers
Featured event boosts	Launch	One-time Stripe payment tied to a specific event
Banner advertising	Launch	Direct sale and manual fulfilment; no ad network in V1.1
Job postings	Post-launch	Useful commercial add-on, but deferred to reduce launch complexity
Event ticketing	Later	Requires third-party payout handling and legal/tax review

5. Non-Functional Requirements

Area	Requirement
Performance	Core public pages should feel fast on mobile; target LCP under 2.5 seconds on major landing pages.
SEO	Every public page needs a unique title, description, and structured data where appropriate. XML sitemap required.
DSGVO / legal basics	Cookie consent, Impressum, Datenschutzerklärung and analytics setup must be in place before launch.
Security	Admin access is protected, webhooks are validated, inputs are sanitised, and public forms are rate-limited.
Observability	Basic error monitoring and alerting are enabled before launch.
Internationalisation	German is default. Architecture can remain i18n-ready, but full English support is not required at launch.
Accessibility	Launch pages should be keyboard-usable, semantically structured and readable on mobile devices.

6. Editorial and Automation Rules

The original concept leaned heavily on automation. This revision keeps automation important, but subject to stricter editorial rules.

- No externally sourced content may auto-publish at launch.
- Every AI-assisted draft must retain source provenance, including source name and source URL or inbox reference where available.
- Duplicate detection should run before items hit the queue whenever automation is added.
- AI should summarise or structure source material; it must not fabricate facts, dates, venues, or contact details.
- If a source cannot be verified or looks low-trust, the item should be rejected or quarantined.
- The first automation milestone after launch is ingestion-to-queue, not ingestion-to-publish.

7. Technical Architecture

7.1 Stack Decisions

Layer	Chosen approach
Framework	Next.js 14 (App Router) with TypeScript
Styling	Tailwind CSS
Database	PostgreSQL via Supabase
Admin auth	NextAuth.js
CMS	Sanity for the news module

Payments	Stripe Checkout + Billing + Customer Portal
Email	Resend
Telegram bot	Grammy
Automation	n8n self-hosted, introduced carefully after launch
AI	Google Gemini via OpenRouter
Hosting	Vercel
Analytics	Plausible
Monitoring	Sentry or equivalent lightweight error monitoring

7.2 Core Data Objects

Object	Purpose	Key fields
Business	Directory listing and subscription state	tier, status, category, town, contact data, opening_hours, telegram_chat_id, stripe IDs
Event	Public event listing and featured status	title, town, venue, dates, organiser, status, is_featured
Article	Local news content	title, slug, town tags, excerpt, body, hero image, publish status
QueueItem	Unified moderation item	content_type, source_type, source_ref, payload, status, reviewer_note
AdSlot	Manual banner management	slot_name, image_url, target_url, start_date, end_date, customer_name
Subscriber	Newsletter and updates	email, consent timestamp, source
ContentSource	Traceability for later automation	source_name, source_type, url_or_ref, trust_level, last_seen_at
BillingRecord	Payment and subscription linkage	product_type, stripe_customer_id, stripe_subscription_id, status

8. Launch Definition of Done

Gate	Definition
Product	Business directory, event listings, and news pages are live and functional on desktop and mobile.
Payments	At least one successful test and one live transaction have completed for subscriptions and event boosts.
Operations	Unified moderation queue works for all enabled submission types.

Telegram beta	At least three real businesses have linked accounts and successfully submitted updates.
Legal	Cookie consent, Impressum, Datenschutzerklärung and payment terms are published.
Supply	At least 50 listings and 20 events exist before public launch.
Commercial proof	At least two paying customers are live at launch or committed for week one.
Performance & QA	Critical pages pass manual QA, links work, and no known blocking bugs remain.

9. Risks and Mitigations

Risk	Likelihood	Impact	Mitigation
Scope expands back toward the original vision	Medium	High	Treat this document as the launch contract. Anything not marked Must is parked.
Local supply is too thin at launch	Medium	High	Seed listings manually, collect event supply before launch, and onboard anchor businesses early.
Telegram parsing causes bad submissions	Medium	Medium	Limit intents, require confirmation, and review every bot submission before publishing.
Automation creates noisy queue items	High	Medium	Introduce ingestion after launch, store source metadata, and block auto-publish.
Revenue takes longer than expected	Medium	High	Keep costs low, prioritise direct outreach, and sell business subscriptions before overbuilding features.
Single-operator overload	Medium	High	Prefer manual-but-fast workflows over brittle automation; cut scope before adding complexity.

10. Post-Launch Expansion Queue

Time horizon	Planned additions
0–30 days after launch	Jobs board, news tip submissions if moderation allows, more banner inventory, RSS feed polishing
31–60 days after launch	AI ingestion beta to admin queue, newsletter automation, social media scheduling

61–90 days after launch	Business reviews, stats dashboard, recurring events, Telegram event/job flows
Later	Ticketing, announcements/classifieds, push notifications, forum/community features, mobile app, regional expansion
